

ABSTRACT

A visual display system includes a display device having an image display region for presenting images to a viewer. The system includes one or more illumination sources that at least partially peripherally surround the image display region and/or project illumination radiated therefrom so as to illuminate a region visually appearing to the viewer to at least partially peripherally surround the image display region. A control device controls light radiation emitted in use from the one or more illumination sources in response to at least one of image and audio indicative signals so as to provide at least a partial spatial extension of the image display region.
